

MediCore Hospital

How the website works

Full explanation for viva, demo and teachers
English + Hinglish · Every tab · Server & database · Mindmaps

Project folder: Desktop/MediCore-Pages
Live (if deployed): <https://medicore-hospital.onrender.com>
This Mac: <http://127.0.0.1:5000>

1. Overview

MediCore is a **hospital website**. Visitors can read about the hospital and book a slot. Staff and admin sign in to run the floor: patients, doctors, beds, pharmacy, scans and bills. A patient signs in and sees **only their own file**. Nothing is fake-on-the-screen-only: when you click Save, the server writes a database.

Hinglish — kaise bolo

Yeh project ek hospital ki website hai. Bahar se koi bhi Home, About, Departments dekh sakta hai aur Book se slot maang sakta hai. Staff/Admin login karke poora hospital chalata hai. Patient login karke sirf apni file dekhta hai. Save dabane par data database mein likh jata hai — sirf dikhawa nahi hai.

What you can say in one breath

- It is a city hospital site (Mumbai story) with a public face and a private console.
- Three doors: Staff, Patient, Admin — same login page, different home after sign-in.
- Public Book creates a **Pending** appointment; staff Confirm it.
- Hindi toggle changes labels; medical IDs stay as DOC-1001 / P-4821.
- This Mac can run it at login. GitHub stores code. Render can host the live URL.

Hinglish — kaise bolo

Ek saans mein: public pages + login ke baad console. Teen role. Book se pending appointment. Hindi button se bhasha. Mac par local, GitHub par code, Render par live site.

2. Server — kya hai, kahan chalta hai

The **server** is a Python program named **Flask** (app.py). It waits for the browser. If you ask for a page like Home, it sends the HTML file. If you ask for /api/login or /api/store/patients, it reads or writes the database and sends JSON.

On **this Mac** the server can start when you log in (LaunchAgent). You open http://127.0.0.1:5000. On the **internet**, Render runs **gunicorn** (a production runner for Flask) inside a Docker container. GitHub does **not** run the hospital — it only stores the files. Render reads GitHub and starts the server.

Hinglish — kaise bolo

Server Matlab ek program jo browser ki request sunta hai. Flask = hamara server. Mac par localhost:5000. Internet par Render gunicorn se chalata hai. GitHub sirf copy rakhta hai, website nahi chalaata.

How a request travels

Mindmap 2 — How a click becomes data

Browser → Server (Flask) → Database → Screen updates

Figure — click se lekar screen update tak.

Hinglish — kaise bolo

Aap click karte ho → Flask decide karta hai page dena hai ya API → database padhta/likhta hai → JSON ya HTML wapas → screen naya data dikhati hai.

3. Database — kahan data rehta hai

The database is the hospital's notebook. Two flavours, same idea:

- **This Mac:** if MySQL is running, Flask uses MySQL (database name medicore). If not, it uses a file medicore-live.db (SQLite).
- **Render (live):** always SQLite inside the service. No separate MySQL to install.
- Tables include: **users** (logins), **doctors**, **patients**, **appointments**, **pharmacy**, **rooms**, **invoices**, **diagnostics**, **alerts**.
- Staff screens load everything once from GET /api/bootstrap, then each Save is PUT /api/store/<name> with the full list.
- Patient screens use GET /api/patient/home so other patients' rows never arrive in the browser.

Hinglish — kaise bolo

Database hospital ki copy hai. Mac par MySQL ya SQLite file. Render par SQLite. Users table se login. Patients/doctors/appointments alag tables. Staff Save = poori list server ko. Patient ko sirf uski row milti hai.

Table	English	Hinglish
users	IDs and password hashes (Staff / Patient / Admin)	Kaun login kar sakta hai
patients	Name, age, ward, doctor, status	Meri file / saari files (staff)
doctors	Roster, department, on/off duty	Doctor list
appointments	OPD slots and status (Pending → Confirmed)	Token / time
rooms	Beds, occupancy, tariff	Ward allotment
invoices	Bills, UPI/card/cash, paid or due	Bill
pharmacy	Medicine name, batch, stock	Dawai stock
diagnostics	ECG, CT, MRI slots	Scan / report
alerts	SMS / email / WhatsApp log (demo unless keys added)	Message register

4. Who signs in (roles)

Who can open what		
STAFF Doctor / nurse desk	PATIENT Own file only	ADMIN Whole hospital
● Full hospital console ● Add / edit patients ● Book and confirm slots ● Pharmacy, wards, bills ● Cannot see other staff passwords	● Patient portal only ● Own reports and bills ● Pay own invoice ● Cannot open staff tabs ● Cannot see other patients	● Same as staff, plus ● Staff / Patients / Admin switch ● Patient portal list ● Sees staff floor and patients ● Used for hospital control

One Sign in page. Three cards: Staff, Patient, Admin. You type ID and password only — **no OTP step**, and **no sample IDs in the boxes** (privacy). Wrong card + right password still fails (a doctor ID will not open on the Patient card).

Hinglish — kaise bolo

Login page par teen card. Sirf ID aur password. OTP nahi. Box mein example ID nahi likhe. Galat card choose kiya to login nahi hoga.

Presenter-only demo IDs (not shown on the website)

Role	ID	Password	Lands on
Staff	DOC-1001	123456	Dashboard
Patient	P-4821	Aarav21	Patient portal
Admin	ADMIN-1000	Admin24	Dashboard + Staff/Patients/Admin switch

Say these aloud in a viva; do not print them on the login screen.

5. Mindmap of every page

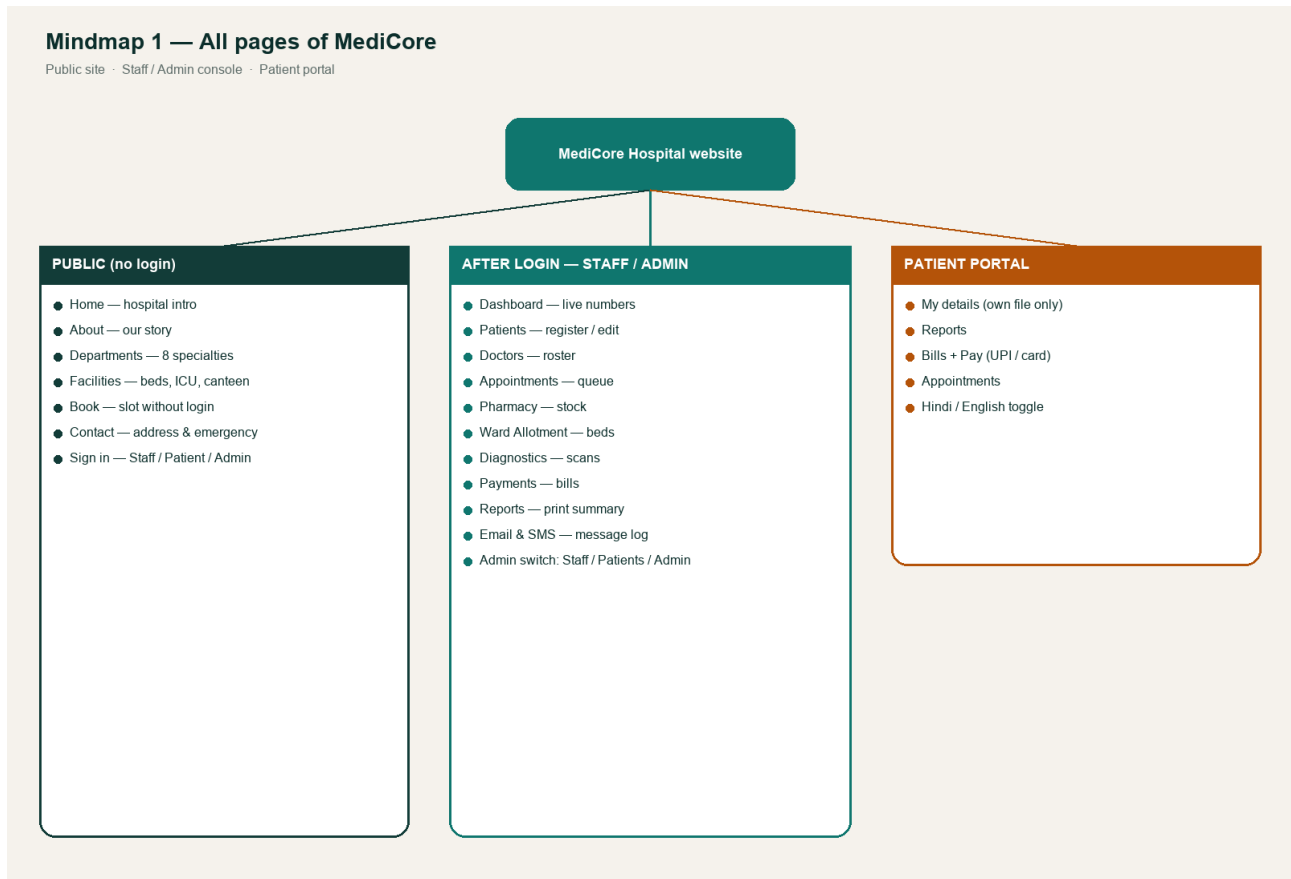

Figure — teen ghar: public, staff console, patient portal.

Hinglish — kaise bolo

Pehle bina login public pages. Login ke baad staff ko left menu milta hai. Patient ko alag simple portal milta hai. Admin upar se view badal sakta hai.

6. Public pages — tab by tab

Home

First impression. Emergency strip, hero, departments preview, visiting hours, photos of campus life. Buttons to Patient login, Staff/Admin, Contact. Hindi toggle in the header.

Hinglish — kaise bolo

Sabse pehli photo-wali page. Emergency number, beds, departments ka preview. Login ke buttons. Header mein ■■■■■■.

About

Why the hospital exists, values, lab/ICU story photos. No login needed.

Hinglish — kaise bolo

Hospital ki kahani aur values. Login ki zaroorat nahi.

Departments

Eight cards: Emergency, Cardiology, Maternity, Paediatrics, Orthopaedics, Diagnostics, Neurology, Oncology. Each card has its own photo (not repeated).

Hinglish — kaise bolo

Aath vibhag. Har card ki alag photo. Emergency 24×7, baaki OPD.

Facilities

Beds, ICU, pharmacy, ambulance, cafeteria. Explains campus, not the console.

Hinglish — kaise bolo

Suvidhaayein: bed, ICU, canteen. Console nahi, campus hai.

Book

Form: name, mobile, department, date, time. Sends POST /api/public/appointment. Status starts as Pending. Staff later Confirm. No account needed.

Hinglish — kaise bolo

Bina login slot maango. Pending rehta hai jab tak staff Confirm na kare.

Contact

Address (Sion–Bandra Link Road story), emergency 022 2416 2400, ambulance 108, hours, how a patient ID is issued at reception.

Hinglish — kaise bolo

Pata, phone, visiting hours. Patient ID reception par milti hai.

Sign in

Staff / Patient / Admin cards, empty ID and password, Continue. Success → dashboard or patient portal. Forgot password tells you to ask the administrator (no OTP screen).

Hinglish — kaise bolo

Teen card, khali boxes, Continue. OTP nahi. Password bhool gaye to admin se kaho.

7. After login — Staff / Admin tabs

Left sidebar is the main menu. Top bar has the page title, a Live pill, your name, Hindi/English, Sign out. Admin also sees **Staff | Patients | Admin** (this used to say Combined; it now says Admin). Staff view = hospital floor. Patients view = portal list. Admin view = both.

Hinglish — kaise bolo

Left menu se saare desks. Upar Live, naam, ■■■■■■, Sign out. Admin ke paas teen button: Staff, Patients, Admin. Pehle Combined likha tha, ab Admin likha hai.

Dashboard

Live KPIs: active patients, doctors on duty, today's appointments, free beds. Today's queue, revenue share, recently admitted, latest alerts. Jump-off page after staff login.

Hinglish — kaise bolo

Pehla screen. Aaj ke numbers: patients, doctors, beds, queue. Yahan se doosri tabs kholte ho.

Patients

Search and filter. Register patient (creates a portal ID + password pattern). Edit name, dept, doctor, status (Admitted / Observation / Discharged). Links to Ward and Bill.

Hinglish — kaise bolo

Naya patient jodo ya purana badlo. Status Admitted/Discharge. Ward aur bill ki shortcuts.

Doctors

Roster. Add doctor, set off duty, optional staff login (DOC-...). You cannot delete your own login.

Hinglish — kaise bolo

Doctor list. Off duty, naya doctor. Apna login khud delete nahi kar sakte.

Appointments

Book from the desk (starts Confirmed) or see public Book rows as Pending. Confirm / Check in / Cancel. Confirm can log an SMS/WhatsApp reminder row.

Hinglish — kaise bolo

Desk se booking Confirmed. Website Book se Pending. Confirm/Cancel yahi se.

Pharmacy

Medicine name, batch, stock vs minimum. Add stock. Low stock is visible in KPIs.

Hinglish — kaise bolo

Dawai, batch, kitni strips. Kam stock dikhta hai.

Ward Allotment

Rooms: ICU, private, general, maternity. Allot a named patient to a free bed, discharge, add a room. Occupancy bars.

Hinglish — kaise bolo

Room aur bed. Patient ko bed do, discharge karo.

Diagnostics

Schedule ECG/CT/MRI etc. Mark Done when the report is ready (can log 'report ready').

Hinglish — kaise bolo

Scan slot. Done matlab report ready.

Payments

Create invoice, collect (UPI/card/cash/insurance), refund, print-style receipt. Today's collections vs dues.

Hinglish — kaise bolo

Bill banao, wasooli, refund, receipt.

Reports

Printable summary of today's work for a file or notice board. Uses the same live data.

Hinglish — kaise bolo

Aaj ka summary print karne ke liye.

Email & SMS

Message register. Templates can be queued. Without Twilio/Gmail keys, rows stay Queued/demo. With keys, the same screen can send for real.

Hinglish — kaise bolo

Message ki copy. Abhi demo log. Real SMS ke liye baad mein Twilio.

8. Patient portal

After P-4821 (or any patient ID) signs in: greeting, own details, reports table, bills with Pay, appointments. Pay opens UPI / card / net banking. On this project it marks the invoice Paid in the database (demo checkout unless Razorpay keys exist). Another patient cannot open this file.

Hinglish — kaise bolo

Patient ko sirf apni details, report, bill, appointment dikhti hai. Pay se bill Paid ho jata hai (demo). Doosre patient ki file nahi khulti.

9. Click-along demo (use this order)

- Open Home — show emergency strip, photos, Hindi button.
- Open Book — submit a test name. Tell them it is Pending.
- Sign in as Staff DOC-1001 / 123456 — Dashboard numbers.
- Appointments — find the Pending row — Confirm.
- Patients — register someone — show new ID.
- Ward — allot a bed. Payments — collect a due bill.
- Sign out. Sign in as Patient P-4821 / Aarav21 — only Aarav's file.
- Sign in as Admin ADMIN-1000 / Admin24 — show Staff / Patients / Admin switch.

Hinglish — kaise bolo

Demo order: Home → Book (pending) → Staff login → Confirm appointment → naya patient → bed → bill → Patient login (sirf apni file) → Admin login (teen buttons).

10. Extra features you can mention

- Hindi / English on public pages and console chrome.
- Logo in the header (teal cross by default; options B/C/D exist as logo-b/c/d).
- Photos: unique per public section, fitted in frames; **no photos inside the after-login menu.**
- Lockout after too many wrong passwords (short wait).
- Live URL on Render; local auto-start on this Mac.

Hinglish — kaise bolo

Hindi button, logo, alag-alag photos public pages par, login ke baad menu mein photo nahi, galat password par thodi der lock, Mac + Render.

11. Two-minute viva script

English

This is MediCore, a hospital website. Outside, anyone can read about departments and book a slot without an account. Staff sign in and get a live console: patients, beds, pharmacy, bills. A patient signs in and sees only their file. The server is Flask; the database is MySQL on this Mac or SQLite on Render. Save writes to the database. GitHub holds the code; Render can host it live.

Hinglish — kaise bolo

Yeh MediCore hai — hospital website. Bahar se departments padho, bina account Book karo. Staff login karke poora floor chalata hai. Patient sirf apni file dekhta hai. Server Flask hai. Database Mac par MySQL ya live par SQLite. Save asli data likhta hai. Code GitHub par, live site Render par.

If something looks stuck on the live URL

Free Render sleeps. Wait about 30 seconds on the first open. Use one gunicorn worker with SQLite so pages do not freeze. After you push code, click Manual Deploy → Clear build cache on Render.

Hinglish — kaise bolo

Pehli baar live link dheere khul sakti hai — 30 second wait. Deploy ke baad Render par Clear build cache karo.

End of guide · MediCore Hospital · Explain with the two mindmaps above.
